Rentra Launches Tokenised Rental-Income Platform to Unlock the Future Value of Real Estate

New platform enables property owners to raise capital against future rental income while retaining ownership of their properties

SINGAPORE, 30 September 2026 — Rentra today announced the launch of its tokenised rental-income platform, a new real-estate financing solution that enables property owners to unlock future rental income without selling or transferring ownership of their properties.

The platform allows property owners to tokenise contractual rights to a defined portion of future rental income and offer these rights to eligible investors and financial institutions. Owners receive capital upfront, while investors gain fractional exposure to real-estate-linked income without acquiring the underlying property.

By combining blockchain-based ownership records with smart contracts, Rentra aims to make rental-income financing more accessible, transparent and efficient, while creating a new channel for investors to access real-estate-linked cash flows.

How the Platform Works

Rentra structures each offering around a defined stream of future rental income from an income-producing property. Rather than tokenising the property itself, the platform tokenises the contractual right to receive a specified portion of future rental proceeds over an agreed financing period.

For example, a property expected to generate $500,000 in net rental income over five years could support an offering of $400,000 in rental-income tokens. Investors provide $400,000 upfront and receive their proportional share of eligible rental proceeds over five years. The difference between the upfront investment and expected future distributions represents the potential return for providing capital and assuming the associated rental-income risks.

Once eligible rental income is received and verified, predefined smart-contract rules calculate and facilitate distributions according to each investor's token holdings. At maturity, the tokenised claim expires, while the property owner retains the property and rental income generated beyond the agreed financing period.

A New Approach to Real-Estate Tokenisation

Unlike models of real-estate tokenisation that fractionalise ownership of the underlying property, Rentra focuses exclusively on future rental-income rights. This allows property

owners to retain ownership of their properties while giving investors exposure to their rental income. Deloitte identifies fractional ownership as one application of real-estate tokenisation, while RealNOI demonstrates an alternative model based on rental-income rights.

The model may also create potential secondary-market liquidity, although this depends on buyer demand and applicable market and regulatory conditions.

Value for Property Owners, Investors and Financial Institutions

For property owners, Rentra converts a defined portion of future rental cash flows into capital today without transferring property ownership. This provides an alternative to conventional refinancing, which can involve secured borrowing, interest costs and lengthy underwriting processes.

For investors, tokenisation enables fractional participation in defined rental-income streams without owning the underlying property. Investors can access smaller investment amounts and receive distributions according to their token holdings, while blockchain-based records provide visibility into ownership and payment history.

For financial institutions, Rentra provides a new channel for accessing real-estate-linked cash flows. Automated issuance, ownership records and distribution rules can reduce manual reconciliation while maintaining an auditable record of transactions.

> "Property owners should not have to choose between selling an asset and waiting years to realise its rental income," said **Daniel Tan, Chief Executive Officer of Rentra.** "By separating the future income stream from property ownership, Rentra creates a new financing option for owners while giving investors access to real-estate-linked cash flows."

About Rentra

Rentra is a real-estate fintech company focused on the tokenisation of future rental-income rights. Its platform enables property owners to monetise defined rental cash flows while retaining property ownership, while providing eligible investors and financial institutions with fractional access to real-estate-linked income.
